

ABSTRACT OF THE DISCLOSURE

A mirror base according to the present invention secures sufficient flexural strength of a support piece relative to a mount piece thanks to a reinforcing core member buried across the mount piece and the support piece, whereby the mount piece and support piece do not have to be integrally molded of a high-rigidity resin or die casting material, but can be integrally molded of a lightweight, inexpensive resin material. Since the core member is provided with mounting nut portions bordering a mounting surface of the mount piece and integrally molded with the core member, there is no need for a post-process of fixing mounting nut bushes or stud bolts to mounting bosses, for example, by heating and press fitting as needed before.
